

CHNOIPS- Protein Synthesis Activity

Background Information

Protein synthesis is the process by which a protein is made. As you learned last semester, a protein is a chain of amino acids held together by a peptide bond. This chain may be 10's, 100's, or even 1000's long and has a specific function (i.e. tubulin microtubules, catalase to unwind DNA, etc.). There are only 20 amino acids; we are able to make 12 in our bodies (termed nonessential) and we must intake the other 8 in the food we eat (essential - isoleucine, leucine, lysine, methionine, phenylalanine, threonine, tryptophan and valine). It is the sequence of the amino acids which determines the specific protein. The sequence of amino acids is determined by our DNA. DNA is the blueprint for all proteins and their respective amino acid sequences. A section of a DNA which codes for a sequence of amino acids (protein) is called gene. It is the specific proteins which gives us our traits and characteristics. In this lab, you will simulate protein synthesis and create a creature called a "CHNOIPS."

Problem

How is the protein synthesis related to our traits and characteristics?

Procedure

You are given the DNA sequences of 6 genes. You are to complete the protein synthesis for each gene and record the trait each protein determines. Once you have determined all 6 traits for your CHNOIPS, you will use those traits to draw out how the CHNOIPS might appear as part of your data in color on the back.
