Link Optimisation for MIMO Communication Systems Ulises Pineda Rico,2010-02 The MIMO antenna array techniques promise to help fulfil the requirements of future networks by offering high space diversity gain and enhanced data rates However there are some considerable challenges with MIMO techniques that must be overcome The most serious of which is

the co channel interference impairment In order to overcome such a challenge precoding is introduced as an excellent choice for complementing the MIMO systems Precoding diverges in two branches the linear algorithms which can achieve reasonable performance at relatively low complexity levels and the non linear techniques which can achieve near optimal capacity but at the expense of higher complexity However the latter shows that any known interference at the transmitter can be subtracted at the receiver without the penalty of degrading the radio resources Following that trend with the intention to find an efficient precoding technique that is able to offer a good trade off between efficacy and complexity we discover that one of the viable choices is to deal with the power constraint during the precoding stage

New Class of Embedded Space Time Block Code for Mimo Wireless Communication Systems Mandana Norouzi,2015

Space-time Code Designs and Fast Decoding for MIMO and Cooperative Communication Systems Yue Shang,2009

Space time coding is an attractive technique to exploit the transmit diversity gain provided by a multiple input multiple output MIMO wireless system Regarding a space time code design some important concerns are high rates full diversity large coding gain diversity products and low decoding complexity However a tradeoff exists among these goals and constructing a good code that optimizes some or all of these goals is a very practical and interesting problem that has attracted a lot of attention in the past 10 years Furthermore other design issues may also matter and should be taken into account when one considers certain special scenarios to which the space time coding technique is applied In this dissertation we study both the code design at the transmitter side and the fast decoding algorithm at the receiver side for space time coding The first topic attempts to achieve both low decoding overhead and maximum full diversity for space time block codes STBC By deploying a linear detector at the receiver we can efficiently reduce the decoding complexity for an STBC and always obtain soft outputs that are desired when the STBC is concatenated with a channel code as in a real system In this dissertation we propose a design criterion for STBC to achieve full diversity with a zero forcing ZF or minimum mean square error MMSE receiver Two families of STBC orthogonal STBC OSTBC and Toeplitz codes which are known to have full diversity with ZF or MMSE receiver indeed meet this criterion as one may expect We also show that the symbol rates of STBC under this criterion are upper bounded by 1 Subsequently we propose a novel family of STBC that satisfy the criterion and thus achieve full diversity with ZF or MMSE receiver Our newly proposed STBC are constructed by overlapping the  $2 \times 2$  Alamouti code and hence are named overlapped Alamouti codes The new codes are close to orthogonal and have asymptotically optimal symbol rates Simulation results show that overlapped Alamouti codes significantly outperform Toeplitz codes for any number of transmit antennas and also outperform OSTBC when the number of transmit antennas is above 4 The second topic concerns the design of space time trellis codes STTC for their applications in cooperative communication systems where transmission among different relay nodes that cooperate with each other is essentially asynchronous A family of STTC that can achieve full cooperative diversity order regardless of the node transmission delays has been proposed and it was shown that the

construction of this STTC family can be reduced to the design of binary matrices that can keep full row rank no matter how their rows are shifted We call such matrices as shift full rank SFR matrices We propose a systematic method to construct all the SFR matrices and in particular the shortest square SFR SSFR matrices that are attractive as the associated STTC require the fewest memories and hence the lowest decoding complexity By relaxing the restriction imposed on SFR matrices we also propose two matrix variations  $q$  SFR and LT SFR matrices In an extended cooperative system model with fractional symbol delays whose maximum value is specified the STTC generated from  $q$  SFR and LT SFR matrices can still achieve asynchronous full diversity As a result more eligible generator matrices than SFR ones become available and some better STTC in terms of coding gain may be found Finally the third topic is to speed up the decoding algorithm for the vertical Bell Laboratories layered space time V BLAST scheme a full rate STBC that however does not exploit any transmit diversity gain A fast recursive algorithm for V BLAST with the optimal ordered successive interference cancellation SIC detection has been proposed and two improved algorithms for it have also been independently introduced by different authors lately We first incorporate the existing improvements into the original fast recursive algorithm to give an algorithm that is the fastest known one for the optimal SIC detection of V BLAST Then we propose a further improvement from which two new algorithms result Relative to the fastest known one from the existing improvements one new algorithm has a speedup of 1.3 times in both the number of multiplications and the number of additions and the other new algorithm requires less memory storage
