Ccv Home Monitoring System:

Alternative Treatments for Troubled Youth R.L. Amdur, William S. Davidson, C.M. Mitchell, R. Redner, 2013-06-29 The purpose of this volume is to present the whole story of our research program on alternative interventions with delinquent youth. It is our goal to describe the development of an alternative intervention model to examine its salient processes to provide a test of its relative effectiveness and to give a description of its systemic impacts. The process described was based on the notion that improvement in our approaches to troubled youth lies in a systematic examination of the efficacy of innovative models. As the reader is probably aware, the history of interventions with troubled youth is more a record of failure than success. Thus the search for alternatives is extremely critical. The book proceeds as a detailed research monograph. The first four chapters describe the historical and theoretical antecedents of the development of the research program. Chapters 5 through 11 describe research on the efficacy of alternative intervention approaches for delinquent youth, research on the impact on nonprofessional change agents, an attempt to integrate contemporary theoretical propositions about delinquency causation and the effects observed, and research examining the systemic consequences of providing innovative interventions to delinquent youth. The final chapter integrates the findings with contemporary work and provides suggestions for future work.

Formal Techniques in Real-Time and Fault-Tolerant Systems Jan Vytöpil, 1991-12-11 This book presents state-of-the-art research results in the area of formal methods for real-time and fault-tolerant systems. The papers consider problems and solutions in safety-critical system design and examine how well the use of formal techniques for design analysis and verification serves in relating theory to practical realities. The book contains papers on real-time and fault-tolerance issues. Formal logic, process algebra, and action event models are applied to specify and model qualitative and quantitative real-time and fault-tolerant behavior to analyze timeliness requirements and consequences of fault hypotheses to verify protocols and program code to formulate formal frameworks for development of real-time and fault-tolerant systems to formulate semantics of languages. The integration and cross-fertilization of real-time and fault-tolerance issues have brought new insights in recent years and these are presented in this book.
