ASEXUAL

For each method of asexual reproduction there are two main types:

Binary fission

Budding

METAPHASE

For asexual reproduction:

The chromosomes are now free in the cytoplasm. Each centrosome has formed a spindle. Microtubules collectively known as the spindle. The chromosomes line up along the middle of the cell and split.

TELOPHASE

When the chromosomes reach the cell, they begin to spiral longer and thinner. A nuclear cell forms around each group, and the cytoplasm will all the process of cytokinesis.

These are two types of asexual reproduction:

During Prophase I, homologous are a pair. The non-sister chromatids are exchanged when the chromosomes are located off and exchanged. In this way, alleles are gene's separated.

What's this? Both of these processes are called. This is beneficial to ensure a better off if changes in some genes are affected by the recombination.

MEIOSIS

Meiosis is a process of cell division that produces four daughter cells.

Meiosis plays an important role in sexual reproduction, as it produces gametes (the eggs and sperm) and in asexual reproduction (mitosis). This occurs in the reproductive system. These cells are different from somatic cells, because they have half the number of chromosomes (a cell has the haploid number). When gametes fuse in the process of fertilization, the resulting cell has a full set of diploid cells.
