

Gastro-Jejunal (G-J) Tube Placement

The G-J tube is normally inserted when a child has difficulty tolerating feeding into the stomach. For example, a child may have problems with chronic vomiting and severe reflux resulting in lack of weight gain, low motility (causing the stomach to be extremely slow at emptying), or stomach abnormalities. This tube is inserted in the same way as a g-tube, through a small hole in the abdomen, directly into the stomach. The tube is then threaded down into the jejunum.

The G-J tube is narrower and longer than a regular g-tube and it is mostly used to give feeds slowly over longer periods of time.

Continual feeds are normally given with this type of tube. While most of the care for this tube is the same as any gastric tube there are a few differences.

Important:

1. The G-J tube needs to be flushed at regular intervals to prevent blockage (pg. 13).
2. The G-J tube empties directly into the intestine and, therefore, certain medications will not be tolerated in the jejunal port. In this case, medications may need to be given via the gastric feeding port. Check with your child's physician or surgeon on how to give medications.
3. When a blockage occurs, your child's physician or surgeon may advise you to utilize a small amount of fizzy (carbonated) fluid via the jejunal port to help remove the blockage. Always follow your physician's or surgeon's instructions regarding any change in your child's care.
4. *Never rotate your child's G-J tube!!*
