

Fuel tank filler hose - removal and refitting

The fuel tank filler hose is the same as the one fitted to carburettor petrol models. Removal and refitting is described in Chapter 4a.

Fuel tank - removal and refitting

Fuel tank and fittings are similar to the ones fitted to carburettor petrol models. Removal and refitting is described in Chapter 4a, but there is a fuel return hose that needs to be disconnected. Mark the fuel feed and return hoses for identification purposes, as they are not mixed up.

Fuel system - priming and bleeding

Warning: Diesel injection pumps supply fuel at very high pressures. Extreme care must be taken when working on the fuel injectors and fuel lines. It is advisable to place an absorbent cloth around the union before disconnecting a fuel line. Never expose the hands, face or any other part of the body to injector spray; the high working pressure can penetrate the skin, with potentially fatal results. Refer also to "Safety first" at the start of the manual.

On disconnecting part of the fuel supply system or turning out of fuel, it is necessary to prime the system and bleed off any air which may have entered the system.

Early models are fitted with a hand-operated priming pump. On models up to February 1983, the priming pump is integral with the fuel filter mounted on the right-hand inner wing, and may be the Roto-diesel or Purflux type. When the plunger is operated, fuel is drawn into the fuel pump and any excess is drawn through the fuel pump outlet and forced to the tank. Later models, from February 1983 onwards, are fitted with a priming pump consisting of a rubber priming bulb and the fuel filter is mounted on the left-hand housing. There is an automatic bleed valve which collects air from vapours at the low-pressure circuit and returns it to the tank without having to pass through the fuel pump (see illustrations).

Bleeding air from the priming pump

Earlier models have a bleed screw on the priming pump, so that air can be expelled from the pump and surrounding pipework before priming. Open the bleed screw and

place a rag around it, then operate the plunger until fuel, free from air, is ejected. Then tighten the bleed screw and mop up any spill fuel from the low-pressure circuit as described below.

Priming the low-pressure circuit

4 Switch on the ignition to position "off" so that the stop solenoid is energised and the pre-heater warning light comes on. If the vehicle has run out of fuel, pour at least two litres of fuel into the tank, with the car on level ground.

5 Operate the pump plunger or squeeze the priming bulb until appreciable resistance is felt.

6 Make sure the pre-heater warning light has gone out.

7 Depress the accelerator pedal by three-quarters of its travel and start the engine. If the engine does not start at the first attempt, wait 15 seconds and try again. If it still doesn't start, operate the plunger or priming bulb again, then make another attempt to start the engine. When the engine starts, accelerate slightly to break priming the fuel circuit.

Bleeding the high-pressure circuit

8 If the engine still fails to start after thoroughly priming the low-pressure circuit, it is likely that air has entered the high-pressure circuit downstream of the fuel pump. To bleed the injector pipes, place a rag of rag around the pipe unions at the injectors, to absorb spill fuel, then loosen the unions. Refer to the

warning at the start of this Section. Close the engine on the starter motor until fuel emerges from the unions, then stop cranking the engine and tighten the unions. Mop up any spill fuel.

9 Start the engine with the accelerator pedal fully depressed. Additional cranking may be necessary to finally bleed the system before the engine starts.

Maximum engine speed - checking and adjustment

Caution: On Roto-diesel injection pumps the maximum speed setting is sealed to the manufacturers at the factory using locking wire and a lead seal. Do not disturb the wire if the vehicle is still within the warranty period otherwise the warranty will be invalidated.

Note: This adjustment requires the use of a tachometer. The usual type of tachometer that sends their signal system pulsed cannot be used on diesel engines. A TDC diagnostic socket is provided for use with Citroën test equipment which will not normally be available to the home mechanic. If you cannot obtain the correct equipment, take the vehicle to a Citroën dealer or other specialist.

Checking

1 Run the engine to normal operating temperature.
