US Key islands FL and southern Europe recently faced DENV outbreaks There are currently no specific treatments or vaccines available Even though several dengue vaccines are in the pipeline clear correlates of protection are still lacking The recent failure of the live attenuated Sanofi vaccine Phase 2b trial Sabchareon et al 2013 and the lack of correlation between clinical protection and in vitro neutralization assays clearly underlines the necessity to better understand the role of the different components of the immune system in protection against dengue virus infection and the requirement for the development of additional and or improved predictive assays The aim of this research topic is to provide novel data opinions and literature reviews on the best immune correlates of protection and recent advances in the immune response to DENV infection that can allow rapid progress of dengue vaccines Authors can choose to submit original research papers reviews or opinions on pre clinical or clinical observations that will help unify the field with perspectives from epidemiology virology immunology and vaccine developers This research topic will discuss different aspects of the protective immune response to DENV that can influence vaccine development It will include a review of epidemiological data generated in the field which will address spatio temporal diversity of DENV epidemics the importance of cross reactive protection and of the time interval between infections as a predictor of disease It will further include a review of the role of both the innate and adaptive immunity in DENV infection control and discuss the usefulness of new improved animal models in dissecting the role of each immunological compartment which will help define new correlate of immune protection New data concerning the DENV structure and anti dengue antibody structure will address the necessity of improved neutralization assays The ultimate test to prove vaccine efficacy and study immune correlates of protection in humans before large trials will open up the discussion on human DENV challenges using controlled attenuated viral strains Finally the role of vaccines administered in flavi immune populations in the modification of future epidemics will also be approached and will include novel studies on mosquitoes infection thresholds

Endemic Kari Nixon, Lorenzo Servitje, 2016-09-01 This book develops a new multimodal theoretical model of contagion for interdisciplinary scholars featuring contributions from influential scholars spanning the fields of medical humanities philosophy political science media studies technoculture literature and bioethics Exploring the nexus of contagion s metaphorical and material aspects this volume contends that contagiousness in its digital metaphorical and biological forms is a pervasively endemic condition in our contemporary moment The chapters explore both endemicity itself and how epidemic discourse has become endemic to processes of social construction Designed to simultaneously prime those new to the discourse of humanistic perspectives of contagion complicate issues of interest to seasoned scholars of science and technology studies and add new topics for debate and inquiry in the field of bioethics *Endemic* will be of wide interest for researchers and educators

Virus in the Cell James Gordon Cook, 1957 In spite of all the wonder drugs used in medicine humanity still does not possess any chemical weapons that can be effectively used against the viruses

that cause disease Viruses live only in association with the cells in which they make their homes and any chemical substance devised to attack the virus will simultaneously damage the host cells To devise drugs that can attack viruses without damaging the host researchers are exploring the separation and recombination of a virus into its constituents thus creating a hybrid to stimulate antibody production against the virus without causing the actual disease Research is progressing but due to underfunding it is painfully slow
