Digital Control Systems Ioan Doré Landau,Gianluca Zito,2005-10-13 The extraordinary development of digital computers microprocessors microcontrollers and their extensive use in control systems in all fields of applications has brought about important changes in the design of control systems Their performance and their low cost make them suitable for use in control systems of various kinds which demand far better capabilities and performances than those provided by analog controllers However in order really to take advantage of the capabilities of microprocessors it is not enough to reproduce the behavior of analog PID controllers One needs to implement specific and high performance model based control techniques developed for computer controlled systems techniques that have been extensively tested in practice In this context identification of a plant dynamic model from data is a fundamental step in the design of the control system The book takes into account the fact that the association of books with software and on line material is radically changing the teaching methods of the control discipline Despite its interactive character computer aided control design software requires the understanding of a number of concepts in order to be used efficiently The use of software for illustrating the various concepts and algorithms helps understanding and rapidly gives a feeling of the various phenomena

Control Systems Engineering and Design S. Thompson,1989

Control Systems Design Vladimir Zakian, 2005-12-27 In recent decades a

comprehensive new framework for the theory and design of control systems has emerged. It treats a range of significant and ubiquitous design problems more effectively than the conventional framework. *Control Systems Design* brings together contributions from the originators of the new framework in which they explain, expand and revise their research work. It is divided into four parts: basic principles including those of matching and inequalities with adjustments for robust matching and matching based on H_∞ methods and linear matrix inequalities; computational methods including matching conditions for transient inputs and design of a sampled data control system; search methods including search with simulated annealing, genetic algorithms and evaluation of the node array method; case studies including applications in distillation, benchmarking, critical control of magnetic levitation systems and the use of the principle of matching in cruise control.
