Quality of Software Architectures Models and Architectures

Steffen Becker, Frantisek Plasil, Ralf H. Reussner, 2008-10-07 Models are used in all kinds of engineering disciplines to abstract from the various details of the modelled entity in order to focus on a specific aspect Like a blueprint in civil engineering a software architecture provides an abstraction from the full software system's complexity It allows software designers to get an overview on the system under development and to analyze its properties In this sense models are the foundation needed for software development to become a true engineering discipline Especially when reasoning on a software system's extra functional properties its software architecture carries the necessary information for early design time analyses These analyses take the software architecture as input and can be used to direct the design process by allowing a systematic evaluation of different design alternatives For example they can be used to cancel out decisions which would lead to architecture signs whose implementation would not comply with extra functional requirements like performance or reliability constraints Besides such quality attributes directly visible to the end user internal quality attributes e.g. maintainability also highly depend on the system's architecture In addition to the above mentioned technical aspects of software architecture models non technical aspects especially project management related activities require an explicit software architecture model The models are used as input for cost estimations time deadline and resource planning for the development teams They serve the project management activities of planning executing and controlling which are necessary to deliver high quality software systems in time and within the budget

Java in Distributed Systems

Marko Boger, 2001-05-25 Large and complex software systems such as Internet applications depend on distributed applications Although Java has helped reduce the complexity of distributed systems developers still have to contend with diverse hardware platforms remote communication over networks and system failures Java in Distributed Systems provides a comprehensive guide for anyone wishing to deepen their knowledge of Java in distributed applications Beginning with a tutorial guide to distributed programming in the Java environment it shows you how building blocks from threads to Jini can help you to fulfil Sun's vision that the Network is the Computer It then goes on to focus on aspects that are still challenging researchers such as concurrency distribution and persistence Key Features One of the few books to focus specifically on Java for building distributed applications Coverage includes threads sockets RMI CORBA Voyager Mobile agents JDBC object oriented databases Java spaces and Jini Includes advanced chapters on the cutting edge of Java language development including the author's own proposed Dejay Distributed Java an open source project that offers a unified approach to concurrency distribution and persistence
