post industrial knowledge societies. Thus numerical development is at the core of both individual as well as societal interests. There is the notion that we are already born with a very basic ability to deal with small numerosities. Yet this often called number sense seems to be very restricted, approximate and driven by perceptual constraints. During our numerical development in formal e.g. school but also informal contexts e.g. family street we acquire culturally developed abstract symbol systems to represent exact numerosities in particular number words and Arabic digits refining our numerical capabilities. In recent years numerical development has gained increasing research interest documented in a growing number of behavioural, neuroscientific, educational, cross-cultural and neuropsychological studies addressing this issue. Additionally our understanding of how numerical competencies develop has also benefitted considerably from the advent of different neuroimaging techniques allowing for an evaluation of developmental changes in the human brain. In sum we are now starting to put together a more and more coherent picture of how numerical competencies develop and how this development is associated with neural changes as well. In the end this knowledge might also lead to a better understanding of the reasons for atypical numerical development which often has grievous consequences for those who suffer from developmental dyscalculia or mathematics learning disabilities. Therefore this Research Topic deals with all aspects of numerical development findings from behavioural performance to underlying neural substrates from cross sectional to longitudinal evaluations from healthy to clinical populations. To this end we included empirical contributions using different experimental methodologies but also theoretical contributions, review articles or opinion papers.

Nitrogen is an essential element in biological systems and one that often limits production in both aquatic and terrestrial systems Due to its requirement in biological macromolecules its acquisition and cycling have the potential to structure microbial communities as well as to control productivity on the ecosystem scale In addition its versatile redox chemistry is the basis of complex biogeochemical transformations that control the inventory of fixed nitrogen both in local environments and over geological time Although many of the pathways in the microbial nitrogen cycle were described more than a century ago additional fundamental pathways have been discovered only recently These findings imply that we still have much to learn about the microbial nitrogen cycle the organisms responsible for it and their interactions in natural and human environments Progress in nitrogen cycle research has been facilitated by recent rapid technological advances especially in genomics and isotopic approaches In this Research Topic we reviewed the leading edge of nitrogen cycle research based on these approaches as well as by exploring microbial processes in modern ecosystems *Hydrogen Energy California Project: Sections 4.3-4.8* California Energy Commission,United States.
