**PATTERN RECOGNITION** C Perez, 2019-05-17 Pattern recognition is a branch of data mining that focuses on the recognition of patterns and regularities in data although it is in some cases considered to be nearly synonymous with machine learning Pattern recognition systems are in many cases trained from labeled training data predictive techniques but when no labeled data are available other algorithms can be used to discover previously unknown patterns descriptive techniques The terms pattern recognition machine learning data mining and knowledge discovery in databases KDD are hard to separate as they largely overlap in their scope Machine learning is the common term for supervised learning methods and originates from artificial intelligence whereas KDD and data mining have a larger focus on unsupervised methods and stronger connection to business use Pattern recognition has its origins in engineering and the term is popular in the context of computer vision a leading computer vision conference is named Conference on Computer Vision and Pattern Recognition In pattern recognition there may be a higher interest to formalize explain and visualize the pattern while machine learning traditionally focuses on maximizing the recognition rates Yet all of these domains have evolved substantially from their roots in artificial intelligence engineering and statistics and they've become increasingly similar by integrating developments and ideas from each other Pattern recognition is generally categorized according to the type of learning procedure used to generate the output value Predictive Techniques assumes that a set of training data the training set has been provided consisting of a set of instances that have been properly labeled by hand with the correct output A learning procedure then generates a model that attempts to meet two sometimes conflicting objectives Perform as well as possible on the training data and generalize as well as possible to new data usually this means being as simple as possible for some technical definition of simple in accordance with Occam's Razor discussed below Descriptive Techniques on the other hand assumes

training data that has not been hand labeled and attempts to find inherent patterns in the data that can then be used to determine the correct output value for new data instances A combination of the two that has recently been explored is semi predictive thecniques which uses a combination of labeled and unlabeled data typically a small set of labeled data combined with a large amount of unlabeled data Note that in cases of descriptive techniques there may be no training data at all to speak of in other words the data to be labeled is the training data      *Solution Manual to Accompany Pattern Classification 2e-Refer to G.
