Heuring, 2004 Computer System Design Michael J. Flynn, Wayne Luk, 2011-08-08

The next generation of computer system designers will be less concerned about details of processors and memories and more concerned about the elements of a system tailored to particular applications. These designers will have a fundamental knowledge of processors and other elements in the system but the success of their design will depend on the skills in making system level tradeoffs that optimize the cost performance and other attributes to meet application requirements. This book provides a new treatment of computer system design particularly for System on Chip SOC which addresses the issues mentioned above. It begins with a global introduction from the high level view to the lowest common denominator the chip itself then moves on to the three main building blocks of an SOC processor memory and interconnect. Next is an overview of what makes SOC unique its customization ability and the applications that drive it. The final chapter presents future challenges for system design and SOC possibilities.

Principles of Computer Hardware Alan Clements, 2006-02-09

The fourth edition of this work provides a readable tutorial based introduction to the subject of computer hardware for undergraduate computer scientists and engineers and includes a companion website to give lecturers additional notes.

Digital Design and Computer Architecture Second Edition takes a unique and modern approach to digital design introducing the reader to the fundamentals of digital logic and then showing step by step how to build a MIPS microprocessor in both Verilog and VHDL. This new edition combines an engaging and humorous writing style with an updated and hands on approach to digital design. It presents new content on I/O systems in the context of general purpose processors found in a PC as well as microcontrollers found almost everywhere. Beginning with digital logic gates and progressing to the design of combinational and sequential circuits the book uses these fundamental building blocks as the basis for the design of an actual MIPS processor. It provides practical examples of how to interface with peripherals using RS232 SPI motor control interrupts wireless and analog to digital conversion. SystemVerilog and VHDL are integrated throughout the text in examples illustrating the methods and techniques for CAD based circuit design. There are also additional exercises and new examples of parallel and advanced architectures practical I/O applications embedded systems and heterogeneous computing plus a new appendix on C programming to strengthen the connection between programming and processor architecture. This new edition will appeal to professional computer engineers and to students taking a course that combines digital logic and computer architecture. Updated based on instructor feedback with
