

Computer Basics and Operating Systems

The computer industry has substantially grown and developed over the past decade. Computer systems have become faster, lighter, powerful and more versatile as the wave of technology grows. Even through all of the innovations and changes, the computing system still has centralized functions that will never change.

To be clear it is essential that you understand the terminology of this section, some of the main terms that are often confusing is that of:

- **Input and Output** – Input is the data that the user provides to the computer system whereas; output is the information that is a result of the processing of data.
- **Information and Data** – Data is the inputted information whereas; information is the resulted displayed information.

The major function of the computing system is centered around the capabilities of the **Central Processing Unit (CPU)**. This essential component of the computing system is responsible for processing instructions that it gathers from the user. It is essentially decodes the code created in programs and other such files running on the computing system. This essential component is built into the hardware of the computing system, it manages the memory and storage allocation within the devices. Without this critical cycle of processing by the CPU the computing system would not be able to function as accurately as the users require.

Within the CPU data is broken down into **Bits**, which are the smallest data. The data is then stored in memory. Once, the data is stored the CPU utilizes ubiquitous computing to process the data into information that the user can understand.

An essential part of this process is that of the **Motherboard**, is the primary circuit board of the computing system. It serves as the transmitter of data to information. Its essential role in the processing of data to information is to store and maintain information to be processed and forward as needed via the input process. The Motherboard has **2 types of memory** that it primarily use:

- **ROM – (Read-only Memory)** – the permanent or non-volatile memory that stores the **BIOS (Basic Input/Output System)**. The BIOS is used to check the devices such as your memory, monitor, keyboard, and disc drives to ensure they are working properly, it also starts up these services.
- **RAM – (Random Access Memory)** – the memory slotted to store programs and data while the computer is in use. This a temporary or volatile memory that is accessed in order to speed up the processing time of a service or device.

In current times there are a variety of computing systems that are still utilized the basic power of the CPU, but in more efficient means. Each one of these computing devices serves their own unique purpose within the technological age we live in. Some of the types of computing devices we utilize today is that of:

- **A personal computer (PC)** is a small microprocessor-based computer designed to be used by one person at a time. It can be a notebook, mobile device, or desktop.
