Demystifying Climate Models Andrew Gettelman, Richard B. Rood, 2016-04-09 This book demystifies the models we use to simulate present and future climates allowing readers to better understand how to use climate model results In order to predict the future trajectory of the Earth's climate climate system simulation models are necessary When and how do we trust climate model predictions The book offers a framework for answering this question It provides readers with a basic primer on climate and climate change and offers non technical explanations for how climate models are constructed why they are uncertain and what level of confidence we should place in them It presents current results and the key uncertainties concerning them Uncertainty is not a weakness but understanding uncertainty is a strength and a key part of using any model including climate models Case studies of how climate model output has been used and how it might be used in the future are provided The ultimate goal of this book is to promote a better understanding of the structure and uncertainties of climate models among users including scientists engineers and policymakers

Climate System Modeling K.E. Trenberth, 2009 **The Climate Modelling Primer** Kendal McGuffie, Ann Henderson-Sellers, 2014-04-07 As a consequence of recent increased awareness of the social and political dimensions of climate many non specialists discover a need for information about the variety of available climate models A Climate Modelling Primer Fourth Edition is designed to explain the basis and mechanisms of all types of current physically based climate models A thoroughly revised and updated edition this book will assist the reader in understanding the complexities and applicabilities of today's wide range of climate models Topics

covered include the latest techniques for modelling the coupled biosphere ocean atmosphere system information on current practical aspects of climate modelling and ways to evaluate and exploit the results discussion of Earth System Models of Intermediate Complexity EMICs and interactive exercises based on Energy Balance Model EBM and the Daisyworld model Source codes and results from a range of model types allows readers to make their own climate simulations and to view the results of the latest high resolution models Now in full colour throughout and with the addition of cartoons to enhance student understanding the new edition of this successful textbook enables the student to tackle the difficult subject of climate modeling

Comprehensive Climate System Modeling on Massively Parallel Computers, 2001 A better understanding of both natural and human induced changes to the Earth's climate is necessary for policy makers to make informed decisions regarding energy usage and other greenhouse gas producing activities To achieve this substantial increases in the sophistication of climate models are required Coupling between the climate subsystems of the atmosphere oceans cryosphere and biosphere is only now beginning to be explored in global models the enormous computational expenses of such models is one significant factor limiting progress A comprehensive climate system model targeted to distributed memory massively parallel processing MPP computers is under development at Lawrence Livermore National Laboratory This class of computers promises the computational power to permit the timely execution of climate models of substantially more sophistication than current generation models Our strategy for achieving high performance on large numbers of processors is to exploit the multiple layers of parallelism naturally contained within highly coupled global climate models The centerpiece of this strategy is the concurrent execution of multiple independently parallelized components of the climate system model This methodology allows the assignment of an arbitrary number of processors to each of the major climate subsystems Hence a higher total number of processors may be efficiently used Furthermore load imbalances arising from the coupling of submodels may be minimized by adjusting the distribution of processors among the submodels

PREFACE Numerical modeling of the global atmosphere has entered a new era Whereas atmospheric modeling was once the domain of a few research units at universities or government laboratories it can now be performed almost anywhere thanks to the affordability of computing power Atmospheric general circulation models GCMs are being used by a rapidly growing scientific community in a wide range of applications With widespread interest in anthropogenic climate change GCMs have a role also in informing policy discussions Many of the scientists using GCMs have backgrounds in fields other than atmospheric sciences and may be unaware of how GCMs are constructed Recognizing this explosion in the application of GCMs we organized a two week course in order to give young scientists who are relatively new to the field of atmospheric modeling a thorough grounding in the basic principles on which GCMs are constructed an insight into their strengths and weaknesses and guidance on how meaningful numerical experiments are formulated and analyzed Sponsored by the North Atlantic Treaty Organization NATO and other institutions this Advanced Study Institute ASI took place May 25 June 5 1998 at Il Ciocco a remote hotel on a Tuscan hillside in Italy

Collaborative Proposal, 2013 Despite the great interest in regional modeling for both weather and climate applications regional modeling is not yet at the stage that it can be used routinely and effectively for climate modeling of the ocean The overarching goal of this project is to transform how climate models are used by developing and implementing a robust efficient and accurate global approach to regional ocean modeling To achieve this goal we will use theoretical and computational means to resolve several basic modeling and algorithmic issues The first task is to develop techniques for transitioning between parameterized and high fidelity regional ocean models as the discretization grid transitions from coarse to fine regions The second task is to develop estimates for the error in scientifically relevant quantities of interest that provide a systematic way to automatically determine where refinement is needed in order to obtain accurate simulations of dynamic and tracer transport in regional ocean models The third task is to develop efficient accurate and robust time stepping schemes for variable spatial resolution discretizations used in regional ocean models of dynamics and tracer transport The fourth task is to develop frequency dependent eddy viscosity finite element and discontinuous Galerkin methods and study their performance and effectiveness for simulation of dynamics and tracer transport in regional ocean models These four projects share common difficulties and will be approached using a common computational and mathematical toolbox This is a multidisciplinary project involving faculty and postdocs from Colorado State University Florida State University and Penn State University along with scientists from Los Alamos National Laboratory The completion of the tasks listed within the discussion of the four sub projects will go a long way towards meeting our goal of developing superior regional ocean models that will transform how climate system models are used

Introduction to Three-Dimensional Climate Modeling Warren M. Washington, Claire Parkinson, 2005-06-24 Warren M Washington is consultant and advisor to a number of government officials and committees on climate system modelling Now along with Claire Parkinson NASA he gives the reader insight into the complex field of climate modelling Updated and revised from the first edition this book is a welcome reference on climate modeling an area that is becoming more and more sought after in light of environmental changes Suitable for those wanting an in road into understanding climate modeling but also an excellent companion for those

with some prior knowledge of modeling meteorological systems

The Community Climate System Model Project from an Interagency Perspective, 2005 In 2007 the Intergovernmental Panel on Climate Change IPCC will publish its Fourth Assessment Report of the Scientific Basis of Climate Change AR4 A significant portion of the AR4 will be the analysis of coupled general circulation model GCM simulations of the climate of the past century as well as scenarios of future climates under prescribed emission scenarios Modeling groups worldwide have contributed to AR4 including three from the U S the Community Climate System Model CCSM project the National Aeronautics and Space Administration NASA Goddard Institute for Space Sciences and the National Oceanic and Atmospheric Administration NOAA Geophysical Fluid Dynamics Laboratory GFDL This collection of model results is providing a wealth of new information that will be used to examine the state of climate science the potential impacts from climate changes and the policy consequences that they imply Our focus here is on the CCSM project Although it is centered at the National Center for Atmospheric Research NCAR the CCSM version 3 CCSM3 was designed developed and applied in a uniquely distributed fashion with participation by many institutions This model has produced some of the most scientifically complete and highest resolution simulations of climate change to date thanks to the teamwork of many scientists and software engineers Their contributions will become obvious as a steady stream of peer reviewed publications appears in the scientific literature Less obvious however is the largely hidden unprecedented level of interagency cooperation and multi institutional coordination that provided the direction and resources necessary to make the CCSM project successful Contrary to the widely held opinion that the US climate research effort in general and the climate modeling effort in particular is fragmented and disorganized NRC 1998 2001 the success of the CCSM project demonstrates that a uniquely US approach to model development can produce a world class model

Climate System Modeling Trenberth KE.,1992 **Earth System Modelling - Volume 1** Kamal Puri,René Redler,Reinhard Budich,2013-03-20 Collected articles in this series are dedicated to the development and use of software for earth system modelling and aims at bridging the gap between IT solutions and climate science The particular topic covered in this volume addresses the usefulness of coupling infrastructures and data management strategies and tools for pre and post processing and coupling software and strategies in regional and global coupled climate models This first part in the series of 6 books sets the scene for the following volumes *Modeling Dynamic Climate Systems* Walter A. Robinson,2013-03-09 The world consists of many complex systems ranging from our own bodies to ecosystems to economic systems Despite their diversity complex systems have many structural and functional features in common that can be effectively modeled using powerful user friendly software As a result virtually anyone can explore the nature of complex systems and their dynamical behavior under a range of assumptions and conditions This ability to model dynamic systems is already having a powerful influence on teaching and studying complexity The books in this series will promote this revolution in systems thinking by integrating skills of numeracy and techniques of dynamic modeling into a variety of disciplines The

unifying theme across the series will be the power and simplicity of the model building process and all books are designed to engage readers in developing their own models for exploration of the dynamics of systems that are of interest to them. Modeling Dynamic Systems does not endorse any particular modeling paradigm or software. Rather the volumes in the series will emphasize simplicity of learning, expressive power, and the speed of execution as priorities that will facilitate deeper system understanding.
