Digital identity management Maryline Laurent, Samia Bouzefrane, Jean-Charles Pomerol, 2015

Digital Identity and the Blockchain Andrej Zwitter, 2020 While classical human identity has kept philosophers busy since millennia Digital Identity seems primarily machine related Telephone numbers E Mail inboxes or Internet Protocol IP addresses are irrelevant to define us as human beings at first glance However with the omnipresence of digital space the digital aspects of identity gain importance In this submission we aim to put recent developments in context and provide a categorization to frame the landscape as developments proceed rapidly First we present selected philosophical perspectives on identity Secondly we explore how the legal landscape is approaching identity from a traditional dogmatic perspective both in national and international law After

blending the insights from those sections together in a third step we will go on to describe and discuss current developments that are driven by the emergence of new tools such as Distributed Ledger Technology and Zero Knowledge Proof One of our main findings is that the management of digital identity is transforming from a purpose driven necessity towards a self standing activity that becomes a resource for many digital applications In other words whereas traditionally identity is addressed in a predominantly sectoral fashion whenever necessary new technologies transform digital identity management into a basic infrastructural service sometimes even a commodity This coincides with a trend to take the control over identity away from governmental institutions and corporate actors to self sovereign individuals who have now the opportunity to manage their digital self autonomously To make our conceptual statements more relevant we present several already existing use cases in the public and private sector Subsequently we discuss potential risks that should be mitigated in order to create a desirable relationship between the individual public institutions and the private sector in a world where self sovereign identity management has become the norm We will illustrate these issues along the discussion around privacy as well as the development of backup mechanisms for digital identities Despite the undeniable potential for the management of identity we suggest that particularly at this point in time there is a clear need to make detailed non technological governance decisions impacting the general design and implementation of self sovereign identity systems
