Transport And Diffusion Across Cell Membranes Wilfred Stein, 2012-12-02 Transport and Diffusion across Cell Membranes is a comprehensive treatment of the transport and diffusion of molecules and ions across cell membranes This book shows that the same kinetic equations with appropriate modification can describe all the specialized membrane transport systems the pores the carriers and the two classes of pumps The kinetic formalism is developed step by step and the features that make a system effective in carrying out its biological role are highlighted This book is organized into six chapters and begins with an introduction to the structure and dynamics of cell membranes followed by a discussion on how the membrane acts as a barrier to the transmembrane diffusion of molecules and ions The following chapters focus on the role of the membrane's protein components in facilitating transmembrane diffusion of specific molecules and ions measurements of diffusion through pores and the kinetics of diffusion and the structure of such pores and their biological regulation This book methodically introduces the reader to the carriers of cell membranes the kinetics of facilitated diffusion and cotransport systems The primary active transport systems are considered emphasizing the pumping of an ion sodium potassium calcium or proton against its electrochemical gradient during the coupled progress of a chemical reaction while a conformational change of the pump enzyme takes place This book is of interest to advanced undergraduate students as well as to graduate students and researchers in biochemistry physiology pharmacology and biophysics

Sample Preparation in Chromatography S.C. Moldoveanu, V. David, 2002-05-08 Sample preparation is an essential step in many analyses This book approaches the topic of sample preparation in chromatography in a methodical way viewing it as a logical connection between sample collection and analytical chromatography Providing a guide for choosing the appropriate sample preparation for a given analysis this book describes various ways to process the sample explaining the principle discussing the advantages and disadvantages describing the applicability to different types of samples and showing the fitness to specific

chromatographic determinations The first part of the book contains an overview of sample preparation showing its relation to sample collection and to the core chromatographic analysis The second part covers procedures that do not use chemical modifications of the analyte and includes methods for sample dissolution concentration and cleanup designed mainly for modifying the initial matrix of the sample This part starts with conventional separations such as filtration and distillation and finishes with more advanced techniques such as solid phase extraction and electroseparations The third part gives a description of the chemical modifications that can be performed on a sample either for fractionation purposes or to improve a specific property of the analyte This part includes derivatizations polymer chemical degradations and pyrolysis
