

Chapter 1

Introduction

The purpose of this chapter is to present suggested guidelines for teaching material from Digital Image Processing at the senior and first year graduate levels. We also discuss use of the book with one. Although the book is mostly self-contained, the web site offers, among other things, complementary lecture material and computer programs that can be assigned in conjunction with classroom work. Detailed solutions to all problems in the book also are included in the remaining chapters of this material.

1.1 Teaching Features of the Book

Undergraduate programs that offer digital image processing typically limit coverage to one semester. Graduate programs vary, and can include one to two semesters of the material. In the following discussion we give general guidelines for a one semester senior course, a first semester graduate course, and a full year course of study covering two semesters. We assume a 15 week program per semester with three lectures per week. In order to provide flexibility for exams and review sessions, the guidelines discussed in the following sections are based on forty 50 minute lectures per semester. The background assumed on the part of the student in senior level preparation in mathematical analysis, matrix theory, probability, and computer programming. The tutorials section in the book with the contains review material on matrix theory and probability and has a brief introduction to linear algebra. PowerPoint presentation material on the review topics is available in the Faculty section of the web site.

The suggested teaching guidelines are presented in terms of general objectives, and not in time schedules. There is so much variety in the core image processing material it is thought that it makes little sense to attempt a breakdown of the material by class period. In particular, the organization of the present edition of

the book is such that it makes it much easier than before to adopt significantly different teaching strategies, depending on course objectives and student background. For example, it is possible with the new organization to offer a course that emphasizes spatial techniques and covers little or no transform material. This is not something we recommend, but it is an option that often is attractive to professors that place little emphasis on the signal processing aspects of the field and prefer to focus more on the implementation of spatial techniques.

1.2 One Semester Senior Course

A basic strategy in teaching a senior course is to focus on aspects of image processing in which both the inputs and outputs of these processes are images. In the scope of a senior course, this usually means the material contained in Chapters 1 through 6. Depending on professor preferences, sections 7 through 11 usually are beyond the scope of coverage in a typical senior curriculum. However, we recommend covering at least some material on image compression (Chapter 8) as outlined below.

We have found in more than three decades of teaching this material to students in electrical engineering, computer science, and other fields of disciplines that one of the keys to success is to spend at least one lecture on motivation and the significance of using images as inputs of the biological material as the input source. The mathematical material is presented in the numerous application cases that 1.1 One Semester Senior Course discussed in Chapter 1. This chapter was prepared with this objective in mind. Some of this material can be covered in class in the first period and the rest assigned as independent reading. Background review should cover probability theory (at one random variable) before image processing (Section 1.1). A brief review of vectors and matrices may be required here, depending on the material covered. The review material in the book will otherwise be designed for just this purpose.

Chapter 1 should be covered in its entirety. Some of the material (Sections 1.1 through 1.1.8) can be assigned as independent reading, but more detailed explanation (coupled with some additional independent reading) of Sections 1.1.9 and 1.1 through 1.1 is recommended. The material in Section 1.1 covers concepts that are used throughout the book and provides a number of image processing applications that are useful as motivational background for the rest of the book.

Chapter 2 covers spatial geometry transformations and spatial convolution and correlation as the foundations of spatial filtering. The chapter also covers a number of different types of spatial transformations and spatial filtering for image enhancement. These techniques are illustrated in the contrast enhancement

Digital Image Processing 3rd Edition Instructor Manual:

Digital Image Processing Rafael C. Gonzalez, Richard Eugene Woods, 2008 A comprehensive digital image processing book that reflects new trends in this field such as document image compression and data compression standards. The book includes a complete rewrite of image data compression, a new chapter on image analysis and a new section on image morphology.

Digital Image Processing and Analysis Scott E. Umbaugh, 2017-11-30 Digital image processing and analysis is a field that continues to experience rapid growth with applications in many facets of our lives. Areas such as medicine, agriculture, manufacturing, transportation, communication systems, and space exploration are just a few of the application areas. This book takes an engineering approach to image processing and analysis, including more examples and images throughout the text than the previous edition. It provides more material for illustrating the concepts along with new PowerPoint slides. The application development has been expanded and updated, and the related chapter provides step-by-step tutorial examples for this type of development. The new edition also includes supplementary exercises as well as MATLAB based exercises to aid both the reader and student in development of their skills.
