and will need to be addressed for a thorough RV process application Examples of issues outside the scope of this document are system interactions interfaces functionality HMI Human Machine Interface and software At the time of publication of this handbook a system level Robustness Validation handbook which addresses these issues had been initiated In late 2006 Members of the SAE International Automotive Electronic Systems Reliability Standards Committee and ZVEI German Electrical and Electronic Manufacturers Association formed a joint task force to update SAE Recommended Practice J1211 NOV1978 Recommended Environmental Practices for Electronic Equipment Design The 1978 version of SAE J1211 was written in an era when electronics were first being introduced to the automobile There was a high level of concern that the harsh environmental conditions experienced in locations in the vehicle could have a serious negative affect on the reliability of electronic components and systems Some early engine control modules ECUs had failure rates in the 350 failures per million hours for 106 h range or expressed in the customer's terms a 25% probability of failure in the first 12 months of vehicle ownership At that time warranty data was presented in R 100 repairs per 100 vehicles units for example 25 R 100 at 12 months In these early years when the automotive electronics industry was in its infancy a large percentage of these were hardcatastrophic and intermittent failures exacerbated by exposure to environmental extremes of temperature 40 C to 85 C high mechanical loads from rough road vibration and rail shipment mechanical shocks of up to 100 g from handling and crash impact severe electrical transients electrostatic discharge and electromagnetic interference large swings in electrical supply voltage reverse electrical supply voltage and exposure to highly corrosive chemicals e g road salt and battery acid The focus of the 1978 version of SAE J1211 was on characterizing these harsh vehicle environment for areas of the vehicle engine compartment instrument panel passenger compartment truck under body etc and suggesting lab test methods which design engineers could use to evaluate the performance of their components and systems at or near the worst case conditions expected in the area of the vehicle where their electrical electronic components would be mounted By testing their prototypes at the worst case conditions i e at the product's specification limits described in the 1978 version of SAE J1211 designers were able to detect and design out weaknesses and thereby reduce the likelihood of failure due to environmental factors By the mid 1980s it became common practice to specify test to pass zero failures allowed environmental conditions based reliability demonstration life tests with acceptance levels in the 90% to 95% reliability range with confidence levels of 70% to 90% This translates to approximately 5 to 20 for 106 h The sample size for these tests was determined using binomial distribution statistical tables and this would result in a requirement to test 6 to 24 test units without experiencing a failure If a failure occurred the sample size would have to be increased and the testing continued without another failure till the bogie was reached The environmental conditions during the test were typically defined such that the units under test were operated at specification limits based on SAE J1211 recommended practices e g 40 C and 85 C for at least some portion of the total test time The goal of passing such a demonstration test was often very challenging and the test

analyze fix programs that resulted although very time consuming and expensive produced much needed reliability growth. Reliability improved significantly in the late 1980s and early 1990s and vehicle manufacturers and their suppliers began expressing warranty data in R 1000 units instead of R 100 units. By the turn of the century automobile warranty periods had increased from 12 months to 3 4 5 and even 10 years for some systems and most manufacturers had started specifying life expectancies for vehicle components of 10 15 and sometimes 20 years. And by this time several vehicle manufacturers and their best electrical electronic component suppliers had improved reliability to the point where warranty data was being expressed in parts per million ppm in the triple double and even single digit range. This translates to failure rates in the 0.05 to 106 h range and better. The achievement of such high reliability is not the result of test to pass reliability demonstration testing based on binomial distribution statistical tables. With this method reliability demonstration in the 99.99% to 99.9999% range would require thousands of test units. On the contrary the methods and techniques used by engineering teams achieving such reliability excellence did not require increasingly large sample sizes more expensive and lengthy testing or more engineers. It is about working smarter not harder and about systems level robust design and robustness validation thinking rather than component level test to pass thinking. The task force leaders and members were of the strong opinion that the 2008 version of SAE J1211 should document the state of the art methods and techniques being used by leading companies and engineering teams to achieve ultra high reliability while at the same time reducing overall cost life cycle and shortening time to market. The SAE International Automotive Electronic Systems Reliability Standards Committee and ZVEI German Electrical and Electronic Manufacturers Association are hopeful that this Handbook for Robustness Validation of Automotive Electrical Electronic Modules will help many companies and engineering teams make the transition from the 1980s cookbook reliability demonstration approach to a more effective economically feasible knowledge based Robustness Validation approach. *Reliability Engineering for Electronic Design* Norman Fuqua, 2020-11-25. This book addresses the needs of electronic design engineers reliability engineers and their respective managers stressing a pragmatic viewpoint rather than a vigorous mathematical presentation. **Next Generation HALT and HASS** Kirk A. Gray, John J. Paschkewitz, 2016-03-08. Next Generation HALT and HASS presents a major paradigm shift from reliability prediction based methods to discovery of electronic systems reliability risks. This is achieved by integrating highly accelerated life test HALT and highly accelerated stress screen HASS into a physics of failure based robust product and process development methodology. The new methodologies challenge misleading and sometimes costly misapplication of probabilistic failure prediction methods FPM and provide a new deterministic map for reliability development. The authors clearly explain the new approach with a logical progression of problem statement and solutions. The book helps engineers employ HALT and HASS by illustrating why the misleading assumptions used for FPM are invalid. Next the application of HALT and HASS empirical discovery methods to quickly find unreliable elements in electronics systems gives readers practical insight to the techniques.

The physics of HALT and HASS methodologies are highlighted illustrating how they uncover and isolate software failures due to hardware software interactions in digital systems. The use of empirical operational stress limits for the development of future tools and reliability discriminators is described. Key features: Provides a clear basis for moving from statistical reliability prediction models to practical methods of insuring and improving reliability. Challenges existing failure prediction methodologies by highlighting their limitations using real field data. Explains a practical approach to why and how HALT and HASS are applied to electronics and electromechanical systems. Presents opportunities to develop reliability test discriminators for prognostics using empirical stress limits. Guides engineers and managers on the benefits of the deterministic and more efficient methods of HALT and HASS. Integrates the empirical limit discovery methods of HALT and HASS into a physics of failure based robust product and process development process. *Principles and Concepts of Reliability for Electronic Equipment and Systems: Part One: Introduction to Electronic Reliability* Stanford University.
