

Real Time Cascade PI Control for Position Monitoring of DC Brushed Motor

Munirah Thembir, Sy. Najib Sy. Salim, M. Nizam Kamardin, Ammarahid Noordin

Abstract— This paper depicts the development of real time motor drive systems. The modelling of Direct Current (DC) motor is vital in this work and hence is discussed in brief. Experimental setup consists of DC motor, rotary encoder, interface card and personal computer is thoroughly configured to obtain useful data such as control signal, speed and position of the motor. User interface and control algorithm is developed using Microsoft Visual C#. Proportional-Integral (PI) algorithm is developed to perform cascade control of the DC motor. The system equipped with fixed inner current loop control parameters while the outer speed and position loop is varied to obtain the most satisfied position and speed of such motor. Through co-simulation of demanded speed and position, detail analysis of real time speed and position is thoroughly discussed.

Keywords— Proportional-Integral (PI) Control, DC brushed motor, position control, Cascade control.

I. INTRODUCTION

Since data collection and systems monitoring are vital in industrial environment, development of real time facilities for control systems has become needy for engineers and technologists. As such, this paper focuses on the real time development of DC motor drive systems. According to [1], a cascade control of DC motor is the most effective for DC drives as it uses first inner current loop and enclosed by outer speed loop. However, for industrial needs such as robotics arm or pick and place systems, it is desired to attach position loop to the system. Therefore, this paper proposed a newly implemented real time cascade control system without inner current loops shown in Fig. 1.

The system consists of primary and secondary loop so-called speed and position loop respectively. All variables abbreviated as CO2, PV2, PV1 and SP1 represent secondary control output, secondary process variable, primary process variable and primary set point respectively. Note that DC represents a disturbance that impacts the PV2 before they impact PV1. Fig.2 shows the system configuration where PIC micro-controller from Microchip is used to build the decoder.

The purpose of decoder is to decode signal from rotary encoder. The outputs of the rotary encoder are sets of pulses train. Specifically, the decoder is named quadrature decoder [2].

II. DC MOTOR MODEL

A separately excited DC motor is used because it has an independent voltage supplies to the field and commutator windings. This type of structure gives advantage of more control over the motor performance [1]. A brushed M586 TE motor manufactured by McLevnon is used in this project. The parameters are listed in Table 1. Motor back e-mf and load torque makes the motor equation non-linear. As such, the state space equations (1), (2) and (3) is derived to provide the simplicity of modelling task. The model is depicted in fig. 3.
