The starting solenoid (10) is an electromagnetic switch that performs the following basic operations:

- The starting solenoid (10) closes the high current starting motor circuit with a low current start switch circuit.
- The starting solenoid (10) engages the pinion for the starting motor (12) with the ring gear.

Solenoid (10) has windings (one or two sets) around a hollow cylinder. A plunger that is spring loaded is inside of the cylinder. The plunger can move forward and backward. When the start switch is closed and electricity is sent through the windings, a magnetic field (9) is made. The magnetic field (9) pulls the plunger forward in the cylinder. This moves the shift lever in order to engage the pinion drive gear with the ring gear. The front end of the plunger then makes contact across the battery and motor terminals of solenoid (10). Next, the starting motor begins to turn the flywheel of the engine.

When the start switch is opened, current no longer flows through the windings. The spring now pushes the plunger back to the original position. At the same time, the spring moves the pinion gear away from the flywheel.

When two sets of solenoid windings are used, the windings are called the hold-in winding and the pull-in winding. Both sets of windings have the same number of turns around the cylinder, but the pull-in winding uses a wire with a larger diameter. The wire with a larger diameter produces a greater magnetic field (9). When the start switch is closed, part of the current flows from the battery through the hold-in windings. The rest of the current flows through the pull-in windings to the motor terminal. The current then flows through the motor to ground. Solenoid (10) is fully activated when the connection across the battery and the motor terminal is complete. When solenoid (10) is fully activated, the current is shut off through the pull-in windings. At this point, only the smaller hold-in windings are in operation. The hold-in windings operate for the duration of time that is required in order to start the engine. Solenoid (10) will now draw less current from the battery, and the heat that is generated by solenoid (10) will be kept at an acceptable level.
