PATTERN RECOGNITION C Perez,2019-05-17 Pattern recognition is a branch of data mining that focuses on the recognition of patterns and regularities in data although it is in some cases considered to be nearly synonymous with machine learning Pattern recognition systems are in many cases trained from labeled training data predictive techniques but when no labeled data are available other algorithms can be used to discover previously unknown patterns descriptive techniques The terms pattern recognition machine learning data mining and knowledge discovery in databases KDD are hard to separate as they largely overlap in their scope Machine learning is the common term for supervised learning methods and originates from artificial intelligence whereas KDD and data mining have a larger focus on unsupervised methods and stronger connection to business use Pattern recognition has its origins in engineering and the term is popular in the context of computer vision a leading computer vision conference is named Conference on Computer Vision and Pattern Recognition In pattern recognition there may be a higher interest to formalize explain and visualize the pattern while machine learning

traditionally focuses on maximizing the recognition rates Yet all of these domains have evolved substantially from their roots in artificial intelligence engineering and statistics and they ve become increasingly similar by integrating developments and ideas from each other Pattern recognition is generally categorized according to the type of learning procedure used to generate the output value Predictice Techniques assumes that a set of training data the training set has been provided consisting of a set of instances that have been properly labeled by hand with the correct output A learning procedure then generates a model that attempts to meet two sometimes conflicting objectives Perform as well as possible on the training data and generalize as well as possible to new data usually this means being as simple as possible for some technical definition of simple in accordance with Occam s Razor discussed below Descriptve Techniques on the other hand assumes training data that has not been hand labeled and attempts to find inherent patterns in the data that can then be used to determine the correct output value for new data instances A combination of the two that has recently been explored is semi predictive thecniques which uses a combination of labeled and unlabeled data typically a small set of labeled data combined with a large amount of unlabeled data Note that in cases of descriptive techniques there may be no training data at all to speak of in other words the data to be labeled is the training data **Classification, Parameter Estimation and State Estimation** Ferdinand van der Heijden,2004-10-29 Classification Parameter Estimation and State Estimation is a practical guide for data analysts and designers of measurement systems and postgraduates students that are interested in advanced measurement systems using MATLAB Prtools is a powerful MATLAB toolbox for pattern recognition and is written and owned by one of the co authors B Duin of the Delft University of Technology After an introductory chapter the book provides the theoretical construction for classification estimation and state estimation The book also deals with the skills required to bring the theoretical concepts to practical systems and how to evaluate these systems Together with the many examples in the chapters the book is accompanied by a MATLAB toolbox for pattern recognition and classification The appendix provides the necessary documentation for this toolbox as well as an overview of the most useful functions from these toolboxes With its integrated and unified approach to classification parameter estimation and state estimation this book is a suitable practical supplement in existing university courses in pattern classification optimal estimation and data analysis Covers all contemporary main methods for classification and estimation Integrated approach to classification parameter estimation and state estimation Highlights the practical deployment of theoretical issues Provides a concise and practical approach supported by MATLAB toolbox Offers exercises at the end of each chapter and numerous worked out examples PRtools toolbox MATLAB and code of worked out examples available from the internet Many examples showing implementations in MATLAB Enables students to practice their skills using a MATLAB environment **A Computer-graphics Separation Algorithm for Pattern Classification and Cluster Analyiss** Gilbert Paul Lauzon,1973
