Circuits, Processors, Compilers and Computers Jan Friso Groote, Rolf Morel, Julien Schmaltz, Adam Watkins, 2021-08-18 This undergraduate textbook first introduces basic electronic circuitry before explaining more advanced elements such as the Arithmetic Logic Unit sequential circuits and finally microprocessors. In keeping with this integrated and graduated approach the authors then explain the relationship to first assembly programming then higher level languages and finally computer organisation. Authors use the Raspberry Pi and ARM microprocessors for their explanations. The material has been extensively class tested at TU Eindhoven by an experienced team of lecturers and researchers. This is a modern holistic treatment of well established topics valuable for undergraduate students of computer science and electronics engineering and for self study. The authors use the Raspberry Pi and ARM microprocessors for their explanations.

**Engineering Embedded Systems** Peter Hintenau, 2014-10-30 This is a textbook for graduate and final year undergraduate computer science and electrical engineering students interested in the hardware and software aspects of embedded and cyberphysical systems design. It is comprehensive and self contained covering everything from the basics to case study implementation. Emphasis is placed on the physical nature of the problem domain and of the devices used. The reader is assumed to be familiar on a theoretical level with mathematical tools like ordinary differential equation and Fourier transforms. In this book these tools will be put to practical use. Engineering Embedded Systems begins by addressing basic material on signals and systems before introducing to electronics. Treatment of digital electronics accentuating synchronous circuits and including high speed effects proceeds to micro controllers, digital signal processors and programmable logic. Peripheral units and decentralized networks are given due weight. The properties of analog circuits and devices like filters and data converters are covered to the extent desirable by a systems architect. The handling of individual elements concludes with power supplies including regulators and converters. The final section of the text is composed of four case studies electric drive control, permanent magnet synchronous motors in particular, lock in amplification with measurement circuits for weight and torque and moisture, design of a simple continuous wave radar that can be operated to measure speed and distance and design of a Fourier transform infrared spectrometer for process applications. End of chapter exercises will assist the student to assimilate the tutorial material and these are supplemented by a downloadable solutions manual for instructors. The pen and paper problems are further augmented with laboratory activities. In addition to its student market Engineering Embedded Systems will assist industrial practitioners working in systems architecture and the design of electronic measurement systems to keep up to date with developments in embedded systems through self study.
