Abstract. Most of the visible matter in the Universe is in a plasma state, or more specifically is composed of ionized or partially ionized gas permeated by magnetic fields. Thanks to recent advances on the theory and detection of cosmic magnetic fields there has been a worldwide growing interest in the study of their role on the formation of astrophysical sources and the structuring of the Universe. In this lecture, I will briefly review the importance of the cosmic magnetic fields both from a theoretical and from an observational perspective, particularly focusing on stellar and compact objects, the interstellar medium and star formation regions, and on galaxies, clusters of galaxies, and the primordial Universe.

Keywords: Magnetic fields in: stars, interstellar medium, jets and accretion disks, galaxies, clusters of galaxies, intracluster and intergalactic medium, and in the early universe.

INTRODUCTION

Few decades ago cosmic magnetic fields were generally regarded as unimportant. Only a few scientists, like Alfvén, Biermann, Chandrasekhar, and Parker, realized the potential role of the magnetism in the Universe. Since then, our view has changed considerably. We know now that most of the visible matter in the Universe is in a plasma state, or more specifically is composed of ionized or partially ionized gas permeated by magnetic fields. There seems to be now no doubts that magnetic fields play a crucial role in: star formation, solar and stellar activity, pulsars, accretion disks, formation and stability of jets, formation and propagation of cosmic rays, and stability of galactic disks. They are also probably crucial in: the interstellar medium (ISM) dynamical evolution, in molecular clouds, supernova remnants, proto-planetary disks, and planetary nebulae, but its importance is still not well understood in: stellar evolution, halos of galaxies, galaxy evolution, and structure formation in the early Universe (e.g., [1]). In this lecture, I will very *briefly* review the importance of the cosmic magnetic fields, particularly focusing on compact objects, the ISM and star formation regions, and on galaxies, clusters, and the early Universe. I will also briefly discuss the potential origin of the cosmic magnetic fields.

Before starting this review, let me consider the magnetic induction equation that describes the magnetic field evolution in a fluid:

$$\frac{\partial \mathbf{B}}{\partial t} = \nabla \times (\mathbf{v} \times \mathbf{B}) + \frac{1}{4\pi\sigma} \nabla^2 \mathbf{B} \quad (1)$$

Where σ is the electric conductivity. The first term of the RHS accounts for the flux freezing between the ionized gas and the magnetic field lines and the second one accounts for the magnetic diffusion. The comparison of the second term with the one of the LHS gives the diffusion time scale for the magnetic field configuration decay, $t_{diff}(L) = 4\pi\sigma L^2$, where L is the characteristic length scale of the spatial variation of $\mathbf{B}$. In most astrophysical systems and environments, the gas is a good conductor and since the typical length scales L are very large, one finds that $t_{diff}(L)$ is generally much longer than the typical dynamical time scales of the systems. This implies that the first term on the RHS (the frozen-in term) generally dominates and the magnetic flux is conserved in most astrophysical plasmas, with the possible exception of magnetic boundary layers or surface discontinuities, like magnetic reconnection regions, where the condition above may be violated. Therefore, as a *golden rule* in Astrophysics, one may say that once magnetic fields are created in cosmic environments it is very difficult to get rid of them!

Geomagnetism and Paleomagnetism David Gubbins, Emilio Herrero-Bervera, 2007-07-19 Understanding the process underlying the origin of Earth magnetic field is one of the greatest challenges left to classical Physics Geomagnetism being

the oldest Earth science studies the Earth's magnetic field in its broadest sense. The magnetic record left in rocks is studied in Paleomagnetism. Both fields have applications pure and applied in navigation in the search for minerals and hydrocarbons in dating rock sequences and in unraveling past geologic movements such as plate motions. They have contributed to a better understanding of the Earth. Consisting of more than 300 articles written by ca. 200 leading experts, this authoritative reference encompasses the entire fields of Geomagnetism and Paleomagnetism in a single volume. It describes in fine detail at an assessable level the state of the current knowledge and provides an up-to-date synthesis of the most basic concepts. As such, it will be an indispensable working tool not only for geophysicists and geophysics students but also for geologists, physicists, atmospheric and environmental scientists, and engineers.

Formation and Evolution of Galaxy Disks José G. Funes, Enrico Maria Corsini, 2008. These are the proceedings of the international conference Formation and Evolution of Galaxy Disks organized by the Specola Vaticana, the Vatican Observatory. The meeting hosted 198 participants from 26 countries. The program consisted of 61 talks and about 130 poster papers. In 2000, the Vatican Observatory organized a conference on Galaxy Disks and Disk Galaxies, the proceedings of which were published in ASP Conference Series Vol. 230. Since that time, a great amount of work has been done in this very active field. October 2007 was deemed an appropriate time to hold another similar conference where outstanding senior and junior astronomers in this field could air new results. The conference was focused on the formation and evolution of galaxy disks and covered the following topics: 1. properties of nearby galaxy disks; 2. interstellar medium, star formation, and chemical evolution; 3. disk edges, outskirts, and environment; 4. accretion onto disks, interactions, and mergers; 5. secular evolution of disks and bar/spiral-driven evolution of galaxies; 6. evolution of disk structural properties; and 7. disk formation in a hierarchical universe. This book is of interest for researchers in extragalactic astronomy. It presents an overview of the relevant results and the progress made in the field in the last seven years. Publisher's website.

Fractional Kinetics In Space: Anomalous Transport Models Vladimir V. Uchaikin, Renat T. Sibatov, 2017-12-12. This book is first of its kind, describing a new direction in modeling processes taking place in interplanetary and interstellar space: magnetic fields, plasma, cosmic rays, etc. This method is based on a special mathematical analysis: fractional calculus. The reader will find in this book a clear physical explanation of the fractional approach and will become familiar with basic rules in this calculus and main results obtained in the frame of this approach. In spite of its profound subject, the book is not overloaded by mathematical details. It contains many illustrations, rich citations, and remains accessible to a wide circle of physicists. This book is addressed to graduate and postgraduate students, young and mature researchers specializing in applications of fractional calculus, astrophysics, solar/terrestrial science, and physics of cosmic rays.
