Analysis Charles M. Judd, Gary H. McClelland, Carey S. Ryan, 2017-05-18 Data Analysis A Model Comparison Approach to Regression ANOVA and Beyond is an integrated treatment of data analysis for the social and behavioral sciences It covers all of the statistical models normally used in such analyses such as multiple regression and analysis of variance but it does so in an integrated manner that relies on the comparison of models of data estimated under the rubric of the general linear model Data Analysis also describes how the model comparison approach and uniform framework can be applied to models that include product predictors i e interactions and nonlinear effects and to observations that are nonindependent Indeed the analysis of nonindependent observations is treated in some detail including models of nonindependent data with continuously varying predictors as well as standard repeated measures analysis of variance This approach also provides an integrated

introduction to multilevel or hierarchical linear models and logistic regression Finally Data Analysis provides guidance for the treatment of outliers and other problematic aspects of data analysis It is intended for advanced undergraduate and graduate level courses in data analysis and offers an integrated approach that is very accessible and easy to teach Highlights of the third edition include a new chapter on logistic regression expanded treatment of mixed models for data with multiple random factors updated examples an enhanced website with PowerPoint presentations and other tools that demonstrate the concepts in the book exercises for each chapter that highlight research findings from the literature data sets R code and SAS output for all analyses additional examples and problem sets and test questions Data Analysis Josh Correll, Abigail M.

Folberg, Charles M. Judd, Gary H. McClelland, Carey S. Ryan, 2025 This essential textbook provides an integrated treatment of data analysis for the social and behavioral sciences It covers all the key statistical models in an integrated manner that relies on the comparison of models of data estimated under the rubric of the general linear model The text describes the foundational logic of the unified model comparison framework It then shows how this framework can be applied to increasingly complex models including multiple continuous and categorical predictors as well as product predictors i e interactions and nonlinear effects The text also describes analyses of data that violate assumptions of independence homogeneity and normality The analysis of nonindependent data is treated in some detail covering standard repeated measures analysis of variance and providing an integrated introduction to multilevel or hierarchical linear models and logistic regression Highlights of the fourth edition include Expanded coverage of generalized linear models and logistic regression in particular A discussion of power and ethical statistical practice as it relates to the replication crisis An expanded collection of online resources such as PowerPoint slides and test bank for instructors additional exercises and problem sets with answers new data sets practice questions and R code Clear and accessible this text is intended for advanced undergraduate and graduate level courses in data analysis Data Analysis Charles M. Judd, Gary H.
