**The Complete Book on Water Soluble Gums and Resins** H. Panda, 2011-10-03 Resins gums and latex are almost ubiquitous in the plant kingdom and many of them continue to play an important role in our daily lives. Numerous plants produce some kind of resin latex or gum but only a few are commercially important today even though their uses and applications are truly manifold. They have been used as adhesives, emulsifiers, thickening agents; they are added to varnishes, paints, and ink; they lend their aromas to perfumes and cosmetics and even play a role in pharmacy and medicine. Gums are viscous substances which are secreted by the bark of certain trees. Usually transparent but sometimes slightly tinted, they contain a mucilage which when dissolved in water makes the latter become viscous. When this mucilage is dissolved in water it can be made to precipitate with alcohol. Resins, on the other hand, are gluey and viscous substances which may be whitish, brownish, or red and are secreted by certain trees when they are incised. Resins contain an essence and are usually not water soluble. Most commonly found types of plant exudates are chemically completely different to gums. Several acacia species are important economically. True gums are complex organic substances mostly obtained from plants, some of which are soluble in water and others of which, although insoluble in water, swell up by absorbing large quantities of it. They are used in adhesives, pharmaceuticals, inks, confections, and other products. Resins are terpene-based compounds. Terpenes constitute one of the largest groups of plant chemicals and they can be very complex. They are not water soluble but can be either oil soluble or spirit soluble depending on their specific chemical composition. Worldwide interest and activity in gums and resins has grown dramatically in the last few years. Governments, environmentalists, research institutions, and other interest groups are among those who have begun to push for stronger support for gums and resins as a way to meet a range of economic, social, and environmental goals. Some of the fundamentals of the book are: photosynthesis and metabolism of carbohydrates, occurrence, properties, and synthesis of the monosaccharides, nitrogen derivatives, carbohydrates in parenteral nutrition, essential carbohydrates, ethers, anhydro sugars, and unsaturated derivatives, constitution of nicotinic acid and of nicotinamide, industrial methods of preparing nicotinic acid and nicotinamide, general physiology, metabolism, and mechanism of the vitamin action, etc. This book gives a complete insight of water soluble gums and resins that are used in day to day life in various industries. It is an invaluable resource to all its readers: students, scientists, new entrepreneurs, existing industries, and others. ### **The Complete Book on Glass and Ceramics Technology (2nd Revised Edition)**

NIIR Board of Consultants & Engineers, 2017-04-09 Ceramics also known as fire clay is an inorganic non metallic solid article which is produced by the art or technique of heat and subsequent cooling The ceramics industry in India came into existence about a century ago and has matured over time to form an industrial base From traditional pottery making the industry has evolved to find its place in the market for sophisticated insulators electronic and electrical items The ceramic industry has been modernizing continuously by newer innovations in product design quality etc Glass is an inorganic product typically produced by melting a mixture of silica soda and calcium compound with desired metallic oxides that serves as coloring agents Indian glass industry will increase on the sidelines of real estate growth across retail residential and office estate Glass production involves the fusion of several inorganic substances These various substances include products such as silica sand soda ash dolomite and limestone representing together 99% of all the raw materials excluding recycled glass Glass ceramics are mostly produced in two steps First a glass is formed by a glass manufacturing process The glass is cooled down and is then reheated in a second step In this heat treatment the glass partly crystallizes In most cases nucleation agents are added to the base composition of the glass ceramic These nucleation agents aid and control the crystallization process Glass ceramics are fine grained polycrystalline materials formed when glasses of suitable compositions are heat treated and thus undergo controlled crystallization to the lower energy crystalline state It is important to emphasize a number of points in this statement on glass ceramics Glass ceramics has helped the electronics industry build much smaller and highly efficient
