

## 6. REGULATION SYSTEM

### 6.1 Description

The compressor is regulated through a combination of electronic, pneumatic, electrical and mechanical devices. Two modes of regulation are used: 'On/Off' is fitted as standard, and 'Modulating' as an optional extra.

### 6.2 On/Off Control

In the 'On/Off' mode, the compressor is regulated by the pressure transmitter, which continuously monitors the pressure in the user's pipework, a run-on time sequence within the controller and an unloader solenoid valve.

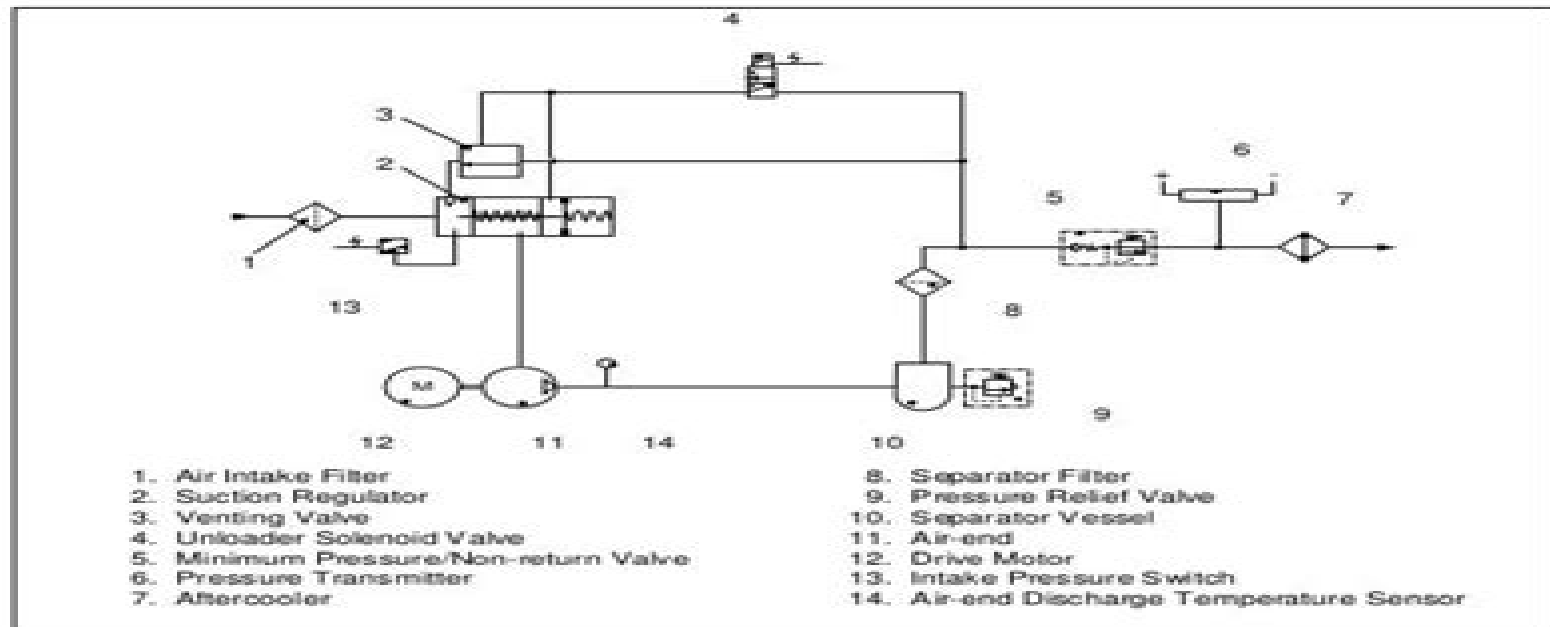

The compressor operates in response to varying air demand in either the on-load condition with the

suction regulator inlet valve fully open, or off-load with the inlet valve fully closed.

When the controller switches the compressor to run off-load, a run-on time sequence is activated. This allows the compressor to run for a pre-set (adjustable) period of time in the off-load condition. If this time elapses before the pressure in the user's pipework has fallen to the lower set point, the compressor stops and enters the 'Standby' condition.

The compressor will remain in the 'Standby' condition until the pressure transmitter senses that the pressure in the user's pipework has fallen to the lower set point. The controller will then re-start the compressor.

If the pressure in the user's pipework falls to the lower set point before the run on time has elapsed, the controller will re-initialise the time sequence and switch the compressor to run on-load.
