*Data-Intensive Computing* Ian Gorton, Deborah K. Gracio, 2012-10-29  
The world is awash with digital data from social networks, blogs, business, science and engineering. Data intensive computing facilitates understanding of complex problems that must process massive amounts of data. Through the development of new classes of software algorithms and hardware, data intensive applications can provide timely and meaningful analytical results in response to exponentially growing data complexity and associated analysis requirements. This emerging area brings many challenges that are different from traditional high performance computing. This reference for computing professionals and researchers describes the dimensions of the field, the key challenges, the state of the art and the characteristics of likely approaches that future data intensive problems will require. Chapters cover general principles and methods for designing such systems and for managing and analyzing the big data sets of today that live in the cloud and describe example applications in bioinformatics and cybersecurity that illustrate these principles in practice.

Improvement of Data Intensive Applications Running on Cloud Computing Clusters Ibrahim Adel Ibrahim, 2019

MapReduce designed by Google is widely used as the most popular distributed programming model in cloud environments. Hadoop, an open source implementation of MapReduce, is a data management framework on large clusters of commodity machines to handle data intensive applications. Many famous enterprises including Facebook, Twitter, and Adobe have been using Hadoop for their data intensive processing needs. Task stragglers in MapReduce jobs dramatically impede job execution on massive datasets in cloud computing systems. This impedance is due to the uneven distribution of input data and computation load among cluster nodes, heterogeneous data nodes, data skew in reduce phase, resource contention situations, and network configurations. All these reasons may cause delay, failure, and the violation of job completion time. One of the key issues that can significantly affect the performance of cloud computing is the computation load balancing among cluster nodes. Replica placement in Hadoop distributed file system plays a significant role in data availability and the balanced utilization of clusters. In the current replica placement policy (RPP) of Hadoop distributed file system (HDFS), the replicas of data blocks cannot be evenly distributed across cluster's nodes.

**Data Intensive Distributed Computing: Challenges and Solutions for Large-scale Information Management** Kosar, Tevfik, 2012-01-31. This book focuses on the challenges of distributed systems imposed by the data intensive applications and on the different state of the art solutions proposed to overcome these challenges. **Cloud Computing** Rajkumar Buyya, James Broberg, Andrzej M. Goscinski, 2010-12-17. The primary purpose of this book is to capture the state of the art in Cloud Computing technologies and applications. The book will also aim to identify potential research directions and technologies that will facilitate creation of a global market place of cloud computing services supporting scientific, industrial, business, and consumer applications. We expect the book to serve as a reference for larger audience such as systems architects, practitioners, developers, new researchers, and graduate level students. This area of research is relatively recent and as such has no existing reference book that addresses it. This book will be a timely contribution to a field that is gaining considerable research interest, momentum, and is expected to be of increasing interest to commercial developers. The book is targeted for professional computer science developers and graduate students, especially at Masters level. As Cloud Computing is recognized as one of the top five emerging technologies that will have a major impact on the quality of science and society over the next 20 years, its knowledge will help position our readers at the forefront of the field.

**Mastering Cloud Computing** Rajkumar Buyya, Christian Vecchiola, S. Thamarai Selvi, 2013-04-05. Mastering Cloud Computing is designed for undergraduate students learning to develop cloud computing applications. Tomorrow's applications won't live on a single computer but will be deployed from and reside on a virtual server accessible anywhere, any time. Ont.). School of Computing, 2013 The rate of data growth in many domains is straining our ability to manage and analyze it. Consequently we see the emergence of computing systems that attempt to efficiently process data intensive applications or I/O bound applications with large data. Cloud computing offers infinite resources on demand and on a pay as you go basis. As a result it has gained interest for large scale data processing. Given this supposedly infinite resource set we need a provisioning process to determine appropriate resources for data processing or workload execution. We observe that the prevalent data processing architectures do not usually employ provisioning techniques available in a public cloud and existing provisioning techniques have largely ignored data intensive applications in public clouds. In this thesis we take a step towards bridging the gap between existing data processing approaches and the provisioning techniques available in a public cloud such that the monetary cost of executing data intensive workloads is minimized. We formulate the problem of provisioning and include constructs to exploit a cloud's elasticity to include any number of resources to host a multi-tenant database system prior to execution. The provisioning is modeled as a search problem and we use standard search heuristics to solve it. We propose a novel framework for resource provisioning in a cloud environment. Our framework allows pluggable cost and performance models. We instantiate the framework by developing various search algorithms cost and performance models to support the search for an effective resource configuration. We consider data intensive workloads that consist of transactional analytical or mixed workloads for evaluation and access multiple database tenants. The workloads are based on standard TPC benchmarks. In addition the user preferences on response time or throughput are expressed as constraints. Our propositions and their results are validated in a real public cloud namely the Amazon cloud. The evaluation supports our claim that the framework is an effective tool for provisioning database workloads in a public cloud with minimal dollar cost.

**BigMobile** Jong Hoon Ahn, 2015 Mobile computing where mobile users continuously gather process and share sensor or application specific data is emerging as a new computing and network paradigm of data sharing in seamless manner. The key enablers are the smartphones e.g. iPhones and Android phones equipped with onboard sensors e.g. cameras accelerometer compass GPS and various wireless devices e.g. WiFi 3G 4G LTE and other network standards. However despite of all the advances in recent years mobile devices have limited resources for computation memory network and battery. Mobile cloud computing MCC is a promising practical approach to relax such constraints in mobile devices for computationally intensive applications where computation offloading to virtually unlimited resources in clouds can help them to save the energy consumption. Existing offloading algorithms and corresponding MCC systems offload computationally intensive applications to remote cloud servers in a distributed manner. However they fail to address challenges in modern data intensive applications where sensor data is continuously harvested and application specific data among users is shared to process or personalize applications. For instance modern machine learning ML based applications require the large amount of training data to train a model often require periodic retraining or adaptation based on gathered user's specific profiles and context data. For such applications

offloading is not only computationally intensive but data intensive and it requires a seamless interface to upload fetch data to from cloud storage A comprehensive survey provides 15 different perspectives in ten major MCC systems from the viewpoint of data intensive computation offloading Typical MCC surveys often constitute network protocol code rewrite requirement offloading granularity profiling resource monitoring cost model and software preinstallation requirement Our survey differs from typical MCC surveys mainly in several ways scalable big data and computing support and fault tolerance of MCC systems providing features such as parallel offloading multi cloud support disconnected operation reliable message delivery cloud sever scalability and cloud storage access The process of computation offloading is complex In this thesis we tackle it as several subsystem problems First existing MCC systems fail to address multiple cloud settings in computation offloading scenarios The application partitioning and offloading to multiple clouds are formally formulated and solved as an integer linear programming ILP problem The objective function of the partitioning problem makes a set of offloading decision in terms of tradeoffs between mobile execution and cloud execution with respect to energy costs and time cost under the assumption of multi clouds Second existing MCC systems fail to address a wireless network instability problem In order to achieve fault tolerant communication between mobile devices and cloud servers we propose and implement a mechanism that can tolerate unstable network conditions by asynchronous implementation of network binding Third existing MCC systems fail to achieve reliable offloading message delivery where millions of mobile devices submit computation offloading requests and data related requests to clouds To achieve such scalability and reliability we propose a producer consumer based message queue where producers for delivering offloading requests send offloading requests over the network to the cluster which in turn serves them up to consumers The multiple consumers are in charge of submitting the offloaded tasks to cloud resources Eventual reliability is achieved by message partitioning and replication in the message queue system while scalable message delivery is achieved by horizontal scaling of producers consumers and reconfiguring of message partition factor Fourth cloud resource management is another challenging area where researchers put little attention to data intensive application offloading Existing MCC systems are not scalable when dealing with millions of offloading requests as well as data requests For the data intensive application offloading we consider integration to one of the conventional big data systems where a thin mobile client is to access data and to process it from the cloud We propose the fuse of Hadoop based parallel computation offloading to multiple clouds by developing seamless interfaces The integration enables our MCC system to be scalable and reliable in scheduling offloading tasks and in serving data related operations on top of Hadoop We provide a couple of evaluation results in terms of time saving and energy saving based on two types of benchmarks computationally intensive applications and data intensive applications For the former we consider chess game puzzle game cryptographic algorithm and Huffman compression algorithm for the latter we consider the state of the art speech recognition application The evaluation extends a single offloading to parallel offloading The further evaluation of data

intensive computational cloud is performed in several aspects performance comparison of Hadoop version 1 and version 2 Hadoop overhead benefit of file compression and performance of cloud storage to support small large files Finally the performance of the proposed message queue is presented      Web-Scale Data Management for the Cloud Wolfgang Lehner,Kai-Uwe Sattler,2013-04-06 The efficient management of a consistent and integrated database is a central task in modern IT and highly relevant for science and industry Hardly any critical enterprise solution comes without any functionality for managing data in its different forms Web Scale Data Management for the Cloud addresses fundamental challenges posed by the need and desire to provide database functionality in the context of the Database as a Service DBaaS paradigm for database outsourcing This book also discusses the motivation of the new paradigm of cloud computing and its impact to data outsourcing and service oriented computing in data intensive applications Techniques with respect to the support in the current cloud environments major challenges and future trends are covered in the last section of this book A survey addressing the techniques and special requirements for building database services are provided in this book as well      Scheduling and Management of Data Intensive Application Workflows in Grid and Cloud Computing Environments Suraj Pandey,2010
