Unfortunately triplet similarity comparisons like many human labeling efforts can be prohibitively expensive This work proposes two techniques for dealing with this obstacle First an alternative display for collecting triplets is designed This display shows a probe image and a grid of query images allowing the user to collect multiple triplets simultaneously The display is shown to reduce the cost and time of triplet collection In addition higher quality embeddings are created with the improved triplet collection UI A 10 000 food item dataset of human taste similarity was created using this UI Second SNaCK a low dimensional perceptual embedding algorithm that combines human expertise with automatic machine kernels is introduced Both parts are complementary human insight can capture relationships that are not apparent from the object s visual similarity and the machine can help relieve the human from having to exhaustively specify many constraints Finally the precise localization of key frames of an action is explored This work focuses on detecting the exact starting frame of a behavior an important task for neuroscience research To address this problem a loss designed to penalize extra and missed action start detections over small misalignments Recurrent neural networks RNN are trained to optimize this loss The model is shown to reduce the number of false positives an important criteria defined by the neuroscientist The performance of the model is evaluated on a new dataset the Mouse Reach Dataset a large annotated video dataset of mice performing a sequence of actions The dataset was created for neuroscience research On this dataset the proposed model outperforms related approaches and baseline methods using an unstructured loss   *Hands-On Algorithms for Computer Vision* Amin Ahmadi Tazehkandi,2018-07-27 Create powerful accurate and real time Computer Vision applications using a perfect blend of algorithms and filters Also learn about object tracking and foreground extractions with a variety of new filters and algorithms Key Features Filter transform and manipulate images using MAT class and OpenCV Framework Explore motion detection and object tracking with filters and algorithms Build object detectors using deep learning and machine learning algorithms Book Description An arena that has been positively impacted by the advancements in processing power and performance is the field of computer vision It s only natural that over time more and more algorithms are introduced to perform computer vision tasks more efficiently Hands On Algorithms for Computer Vision is a starting point for anyone who is interested in the field of computer vision and wants to explore the most practical algorithms used by professional computer vision developers The book starts with the basics and builds up over the course of the chapters with hands on examples for each algorithm Right from the start you will learn about the required tools for computer vision development and how to install and configure them You ll explore the OpenCV framework and its powerful collection of libraries and functions Starting from the most simple image modifications filtering and transformations you will gradually build up your knowledge of various algorithms until you are able to perform much more sophisticated tasks such as real time object detection using deep learning algorithms What you will learn Get to grips with machine learning and artificial intelligence algorithms Read write and process images and videos Perform mathematical matrix and other types of image data operations Create and use
