**Design and Operating Guide for Aquaculture Seawater Systems** John E. Huguenin, John Colt, 1989 The primary  
objective of this book is to provide basic information and considerations needed for the design construction and operation of  
seawater systems for culturing purposes The seawater flow rate range of 10 1000 gallons approximately 40 4000 liters per  
minute has been chosen because it includes the vast majority of such systems currently in use While the objectives of these  
systems vary widely they all depend on a common technological and biological data base Since the seawater system is usually  
only a means to an end most potential users have little prior practical experience or technical knowledge in this area  
Practical information on seawater systems for culturing purposes tends to be fragmented and not readily available in usable  
form Most conventional engineering experience is with marine systems which are orders of magnitude larger This technology  
is often not readily scaled down or directly useable and more than likely prohibitively expensive The subject of this book
