With the Internet, the proliferation of Big Data and autonomous systems, mankind has entered into an era of digital obesity. In this century, computational intelligence, such as thinking machines, have been brought forth to process complex human problems in a wide scope of areas from social sciences, economics and biology, medicine and social networks to cyber security. The Handbook of Computational Intelligence in two volumes prompts readers to look at these problems from a non-traditional angle. It takes a step-by-step approach supported by case studies to explore the issues that have arisen in the process. The Handbook covers many classic paradigms as well as recent achievements and future promising developments to solve some of these very complex problems. Volume one explores the subjects of fuzzy logic and systems, artificial neural networks and learning systems. Volume two delves into evolutionary computation, hybrid systems as well as the applications of computational intelligence in decision making, the process industry, robotics and autonomous systems. This work is a one-stop shop for beginners as well as an inspirational source for more advanced researchers. It is a useful resource for lecturers and learners alike.
