system used to obtain the tire contact pressures consisted of three main components being a load frame powered by an manual hydraulic system for mounting and loading the test tires Fuji pressure sensitive film to record pressure distributions and a film analysis package using the Adage 3006 Graphics system to process the pressure distribution data The contact pressure data was presented as numerical pressure distribution maps and also illistrated as two dimensional color spectral graphics and three dimensional surface plots The experiments indicated that for the 11R24 5 radial tire and the 18 22 5 bias tire increased wheel loads at constant inflation pressures generally resulted in more uniform contact pressures throughout the contact area The same increased wheel loads were also accommodated by a lengthening of the contact area On the other hand increased inflation pressures at constant wheel loads resulted in a reduction of contact area and increased contact pressures in the contact patch s central region Low inflation pressures tended to cause the wheel load to be distributed more heavily to the contact patch s central area for the radial tire and more heavily to the sidewall contact area for the bias tire
