Applied Data Analytic Techniques For Turning Points Research Patricia Cohen,2012-10-12 This innovative volume demonstrates the use of a range of statistical approaches that examine turning points a change in direction magnitude or meaning in real data Analytic techniques are illustrated with real longitudinal data from a variety of fields As such the book will appeal to a variety of researchers including Developmental researchers interested in identifying factors precipitating turning points at various life stages Medical or substance abuse researchers looking for turning points in disease or recovery Social researchers interested in estimating the effects of life experiences on subsequent behavioral changes Interpersonal behavior researchers looking to identify turning points in relationships Brain researchers needing to discriminate the onset of an experimentally produced process in a participant The book opens with the goals and theoretical considerations in defining turning points An overview of the methods presented in subsequent chapters is then provided Chapter goals include discriminating local from long term effects identifying variables altering the connection between trajectories at different life stages locating non normative turning points coping with practical distributional problems in trajectory analyses and changes in the meaning and connections between variables in the

transition to adulthood. From an applied perspective the book explores such topics as antisocial aggressive trajectories at different life stages the impact of imprisonment on criminal behavior family contact trajectories in the transition to adulthood sustained effects of substance abuse alternative models of bereavement and identifying brain changes associated with the onset of a new brain process. Ideal for advanced students and researchers interested in identifying significant change in data in a variety of fields including psychology medicine education political science criminology and sociology Longitudinal Structural Equation Modeling Jason T. Newsom, 2015-06-19 This comprehensive resource reviews structural equation modeling SEM strategies for longitudinal data to help readers see which modeling options are available for which hypotheses. The author demonstrates how SEM is related to other longitudinal data techniques throughout. By exploring connections between models readers gain a better understanding of when to choose one analysis over another. The book explores basic models to sophisticated ones including the statistical and conceptual underpinnings that are the building blocks of the analyses. Accessibly written research examples from the behavioral and social sciences and results interpretations are provided throughout. The emphasis is on concepts and practical guidance for applied research rather than on mathematical proofs. New terms are highlighted and defined in the glossary. Figures are included for every model along with detailed discussions of model specification and implementation issues. Each chapter also includes examples of each model type comment sections that provide practical guidance model extensions and recommended readings. Highlights include: Covers the major SEM approaches to longitudinal analysis in one resource. Explores connections between longitudinal SEM models to enhance integration. Numerous examples that help readers match research questions to appropriate analyses and interpret results. Reviews practical issues related to model specification and estimation to reinforce connections. Analyzes continuous and discrete binary and ordinal variables throughout for breadth not found in other sources. Reviews key SEM concepts for those who need a refresher. Ch 1 Emphasizes how to apply and interpret each model through realistic data examples. Provides the book's data sets at www.longitudinalsem.com along with the Mplus and R lavaan syntax used to generate the results. Introduces the LISREL notation system used throughout Appendix A. The chapters can be read out of order but it is best to read chapters 1-4 first because most of the later chapters refer back to them. The book opens with a review of latent variables and analysis of binary and ordinal variables. Chapter 2 applies this information to assessing longitudinal measurement invariance. SEM tests of dependent means and proportions over time points are explored in Chapter 3 and stability and change difference scores and lagged regression are covered in Chapter 4. The remaining chapters are each devoted to one major type of longitudinal SEM: repeated measures analysis models, full cross lagged panel models and simplex models, modeling stability with state trait models, linear and nonlinear growth curve models, latent difference score models, latent transition analysis, time series analysis, survival analysis and attrition. Missing data is discussed in the context of many of the preceding models in Chapter 13. Ideal for graduate courses on longitudinal data analysis advanced SEM longitudinal SEM
